

Product Announcement

EZ Dock Couplers **311010**
Composite Hardware Bolt **211003**
Composite Hardware Nut **22003**

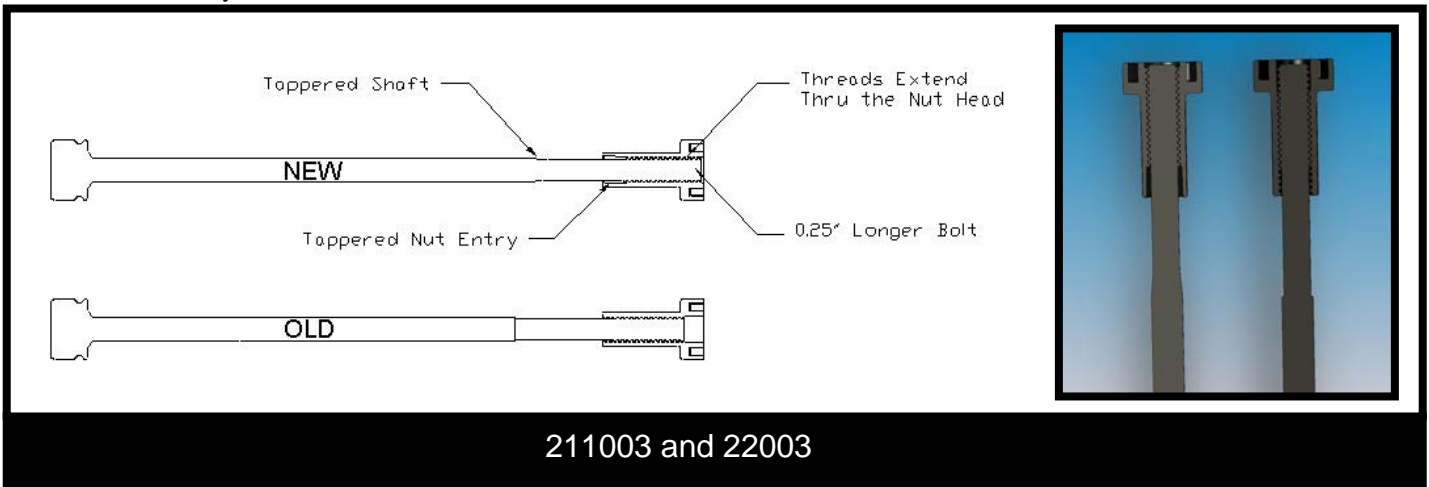

Features and Benefits

Implementation Date: 03-20-09

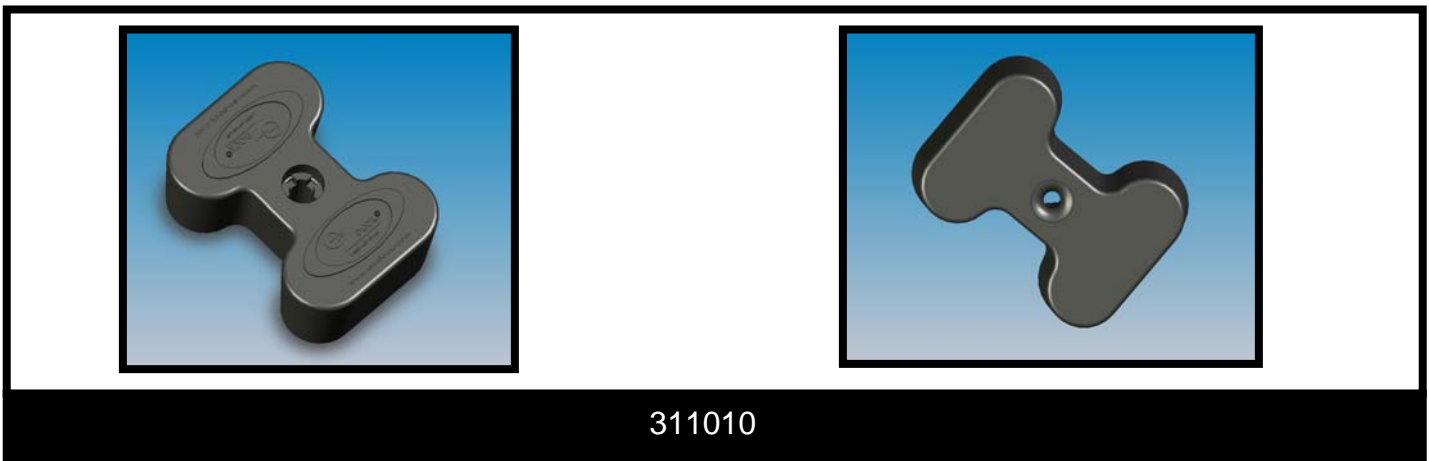

As an effort to improve our product line, EZ Dock has redesigned the couplers and composite hardware to increase durability and simplify installation. In the near future all new purchases will include these improved features. As the new components are released, each box will be identified with a large orange sticker to signify the newer revisions.

Note: All composite hardware is compatible with either revision of the rubber couple however; the revisions of the composite hardware components should not be mixed.

Composite Hardware- The coupler composite hardware nuts and bolts will have a few modifications. In the past, the threads of the nuts extended from the bottom of the nut and only up to the base of the nut head. This new revision will allow the threads to extend all the way through the nut head. This change will allow the full strength of the cross sectional area of the nut to support all transitional forces. In addition, the step on the shank of the bolt will now be tapered and bolts will be 3/16" longer than before. These modifications will allow the coupler sets to have increased mechanical properties while still allowing the dock sections to function effectively.

Couplers- With the arrival of the new coupler tooling: we will maintain the same overall dimensions and material, but the bottom is modified with a funneled hole to allow the top coupler to be easily installed. Other changes include the double logo and website.
